PKCS#1 encryption defined in PKCS#1 v1.5 standard.

TLS handshake for RSA transport

Client

Server

Pick random Nc

ClientHello, MaxVer, Nc, Ciphers/CompMethods →

← ServerHello, Ver, Ns, SessionID, Cipher/CompMethod

Pick random Ns

Check CERT using CA public verification key

← CERT = (pk of bank, signature over it)

Pick random PMS
C <- E(pk,PMS)

C →

PMS <- D(sk,C)

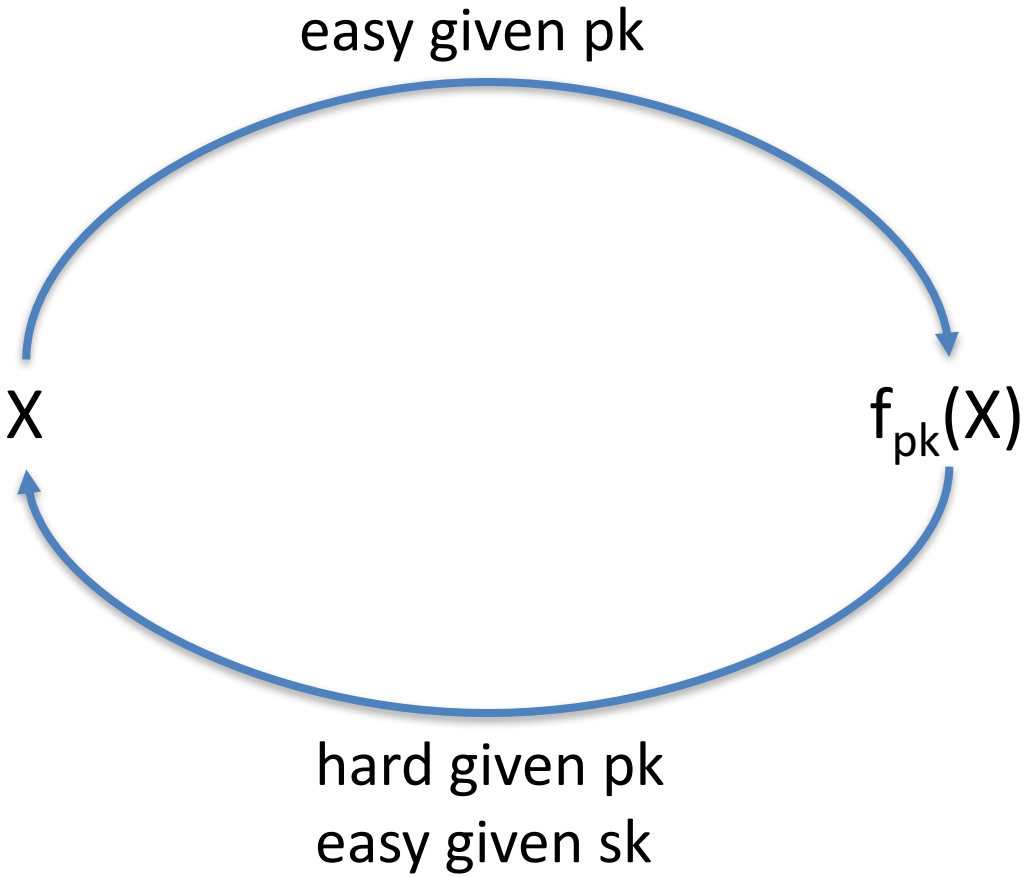
ChangeCipherSpec,
{ Finished, PRF(MS, “Client finished” || H(transcript)) } →

ChangeCipherSpec,
{ Finished, PRF(MS, “Server finished” || H(transcript’)) } ←

Bracket notation means contents encrypted

MS <- PRF(PMS, “master secret” || Nc || Ns)

Trapdoor functions



The RSA trapdoor function

- Rivest, Shamir, Adleman 1978
- Garnered them a Turing award

RSA math

Let N be a positive number

Looking ahead: N = pq for large primes p,q

N will be called the modulus

p = 7, q = 13, gives N = 91

p = 17, q = 53, gives N = 901

RSA math

Let N be a positive number

Looking ahead: N = pq for large primes p,q

N will be called the modulus

$\mathbf{Z}_N = \{0,1,2,3,\ldots, N-1\}$

$\mathbf{Z}_N^* = \{ i \mid \gcd(i,N) = 1 \text{ and } i < N\}$

gcd(X,Y) = 1 if greatest common divisor of X,Y is 1

RSA math

$\mathbf{Z}_N^* = \{ i \mid \gcd(i,N) = 1 \}$

$N = 13 \qquad \mathbf{Z}_{13}^* = \{ 1,2,3,4,5,6,7,8,9,10,11,12 \}$

$N = 15 \qquad \mathbf{Z}_{15}^* = \{ 1,2,4,7,8,11,13,14 \}$

The size of a set S is denoted by $|S|$

Def. $\phi(N) = |\mathbf{Z}_N^*|$ (This is Euler's totient function)

$\phi(13) = 12$

$\phi(15) = 8$

$\mathbf{Z}_{\phi(15)}^* = \mathbf{Z}_8^* = \{ 1,3,5,7 \}$

RSA math

$\mathbf{Z}_N^* = \{ i \mid \gcd(i,N) = 1 \}$

Fact. For any a,N with N > 0, there exists unique q,r such that

$a = Nq + r$ and $0 \le r < N$

$17 \bmod 15 = 2$ $105 \bmod 15 = 0$

Def. $a \bmod N = r \in \mathbf{Z}_N$

Def. $a \equiv b \pmod N$ iff $(a \bmod N) = (b \bmod N)$

Operations work in natural way:

$a \bullet b \bmod N$ $a+b \bmod N$

RSA math

$\mathbf{Z}_N^* = \{ i \mid \gcd(i,N) = 1 \}$

$(\mathbf{Z}_N^* , \bullet)$ is a **group**

Group is a set and operator $(G,\bullet)$that satisfy:

1. Closure: for all $a,b \in G$ it holds that $a \bullet b \in G$
2. Associativity: for all $a,b,c \in G$ it holds that $a \bullet (b \bullet c) = (a \bullet b) \bullet c$
3. Identity: Exists $I \in G$ s.t. for all $a \in G$ $a \bullet I = a$
4. Inverses: for $a \in G$ there exists $a^{-1} \in G$ s.t. $a \bullet a^{-1} = I$

Abelian group is additionally commutative:

for all $a,b \in G$ it holds that $a \bullet b = b \bullet a$

RSA math

$\mathbf{Z}_N^* = \{ i \mid \gcd(i,N) = 1 \}$

$(\mathbf{Z}_N^* , \bullet)$ is a **group**

Group is a set and operator $(G,\bullet)$that satisfy:

1. Closure: for all $a,b \in G$ it holds that $a \bullet b \in G$
2. Associativity: for all $a,b,c \in \mathbf{Z}_N^*$ it holds that $a \bullet (b \bullet c) = (a \bullet b) \bullet c$
3. Identity: Exists $I \in \mathbf{Z}_N^*$ s.t. for all $a \in \mathbf{Z}_N^*$ $a \bullet I = a$
4. Inverses: for $a \in \mathbf{Z}_N^*$ there exists $a^{-1} \in \mathbf{Z}_N^*$ s.t. $a \bullet a^{-1} = I$

RSA math

$\mathbf{Z}_N^* = \{ i \mid \gcd(i,N) = 1 \}$

$(\mathbf{Z}_N^* , \bullet)$ is a **group**

$$\mathbf{Z}_{15}^* = \{ 1,2,4,7,8,11,13,14 \}$$

$2 \bullet 7 \equiv 14 \pmod{15}$

$4 \bullet 8 \equiv 2 \pmod{15}$

Closure: for any $a,b \in \mathbf{Z}_N^*$ $\quad a \bullet b \bmod N \in \mathbf{Z}_N^*$

Def. $a^i \bmod N = \underbrace{a \bullet a \bullet a \bullet \ldots \bullet a}_{i \text{ times}} \bmod N$

Some needed algorithms

Algorithm	**Running time (n = log N)**
Modular multiplication ab mod N	$O(n^2)$
Modular exponentation a^i mod N	$O(n^3)$
Modular inverse a^{-1} mod N	$O(n^2)$

Textbook exponentiation

Let G be a group.
How do we compute h^x for any $h \in G$?

Exp(h,x)
X' = h
For i = 2 to x do
    X' = X'*h
Return X'

Requires time O(|G|) in worst case.

SqrAndMulExp(h,x)
$b_k,\ldots,b_0 = x$
f = 1
For i = k down to 0 do
    $f = f^2$
    If $b_i = 1$ then
        f = f*h
Return f

Requires time O(k) multiplies and squares in worst case.

SqrAndMulExp(h,x)

$b_k,\ldots,b_0 = x$

f = 1

For i = k down to 0 do

    $f = f^2$

    If $b_i = 1$ then

        f = f*h

Return f

$$x = \sum_{b_i \neq 0} 2^i$$

$$h^x = h^{\sum_{b_i \neq 0} 2^i} = \prod_{b_i \neq 0} h^{2^i}$$

$$h^{11} = h^{8+2+1} = h^8 \bullet h^2 \bullet h$$

$b_3 = 1$ $f_3 = 1 \bullet h$

$b_2 = 0$ $f_2 = h^2$

$b_1 = 1$ $f_1 = (h^2)^2 \bullet h$

$b_0 = 1$ $f_0 = (h^4 \bullet h)^2 \bullet h = h^8 \bullet h^2 \bullet h$

Don't implement this algorithm: side-channel attacks

RSA math

$\mathbf{Z}_N^* = \{ i \mid \gcd(i,N) = 1 \}$

Claim: Suppose $e,d \in \mathbf{Z}^*_{\phi(N)}$ satisfying $ed \bmod \phi(N) = 1$
then for any $x \in \mathbf{Z}_N^*$ we have that

$$(x^e)^d \bmod N = x$$

$$(x^e)^d \bmod N = x^{(ed \bmod \phi(N))} \bmod N$$
$$= x^1 \bmod N$$
$$= x \bmod N$$

First equality is
by Euler's Theorem

RSA math

$\mathbf{Z}_N^* = \{ i \mid \gcd(i,N) = 1 \}$

Claim: Suppose $e,d \in \mathbf{Z}_{\phi(N)}^*$ satisfying $ed \bmod \phi(N) = 1$ then for any $x \in \mathbf{Z}_N^*$ we have that

$$(x^e)^d \bmod N = x$$

$\mathbf{Z}_{15}^* = \{ 1,2,4,7,8,11,13,14 \}$ $\mathbf{Z}_{\phi(15)}^* = \{ 1,3,5,7 \}$

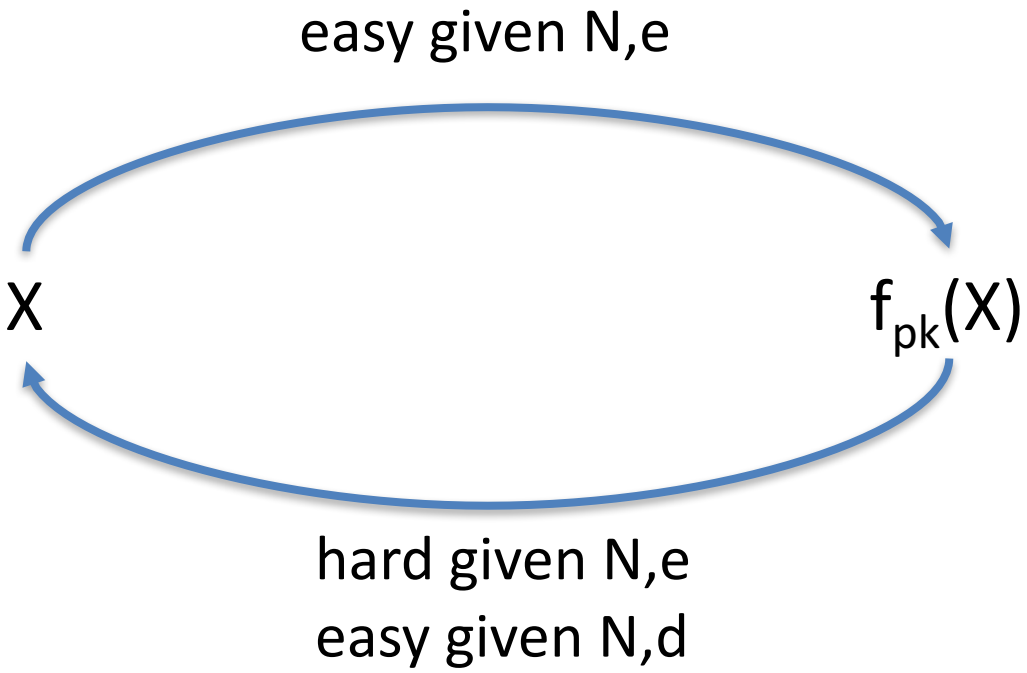
$e = 3$, $d = 3$ gives $ed \bmod 8 = 1$

x	1	2	4	7	8	11	13	14
$x^3 \bmod 15$	1	8	4	13	2	11	7	14
$y^3 \bmod 15$	1	2	4	7	8	11	13	14

The RSA trapdoor permutation

pk = (N,e) sk = (N,d) with ed mod $\phi(N) = 1$

$f_{N,e}(x) = x^e \bmod N$ $g_{N,d}(y) = y^d \bmod N$



The RSA trapdoor permutation

pk = (N,e) sk = (N,d) with ed mod $\phi(N) = 1$

$f_{N,e}(x) = x^e \bmod N$ $g_{N,d}(y) = y^d \bmod N$

But how do we find suitable N,e,d ?

If p,q distinct primes and N = pq then $\phi(N) = (p-1)(q-1)$

Why?

$$\begin{aligned}\phi(N) &= |\{1,\ldots,N-1\}| - |\{ip : 1 \le i \le q-1\}| - |\{iq : 1 \le i \le p-1\}| \\ &= N-1 - (q-1) - (p-1) \\ &= pq - p - q + 1 \\ &= (p-1)(q-1)\end{aligned}$$

The RSA trapdoor permutation

pk = (N,e) sk = (N,d) with ed mod $\phi(N) = 1$

$f_{N,e}(x) = x^e \bmod N$ $g_{N,d}(y) = y^d \bmod N$

But how do we find suitable N,e,d ?

If p,q distinct primes and N = pq then $\phi(N) = (p-1)(q-1)$

Given $\phi(N)$, choose $e \in \mathbf{Z}^*_{\phi(N)}$ and calculate

$d = e^{-1} \bmod \phi(N)$

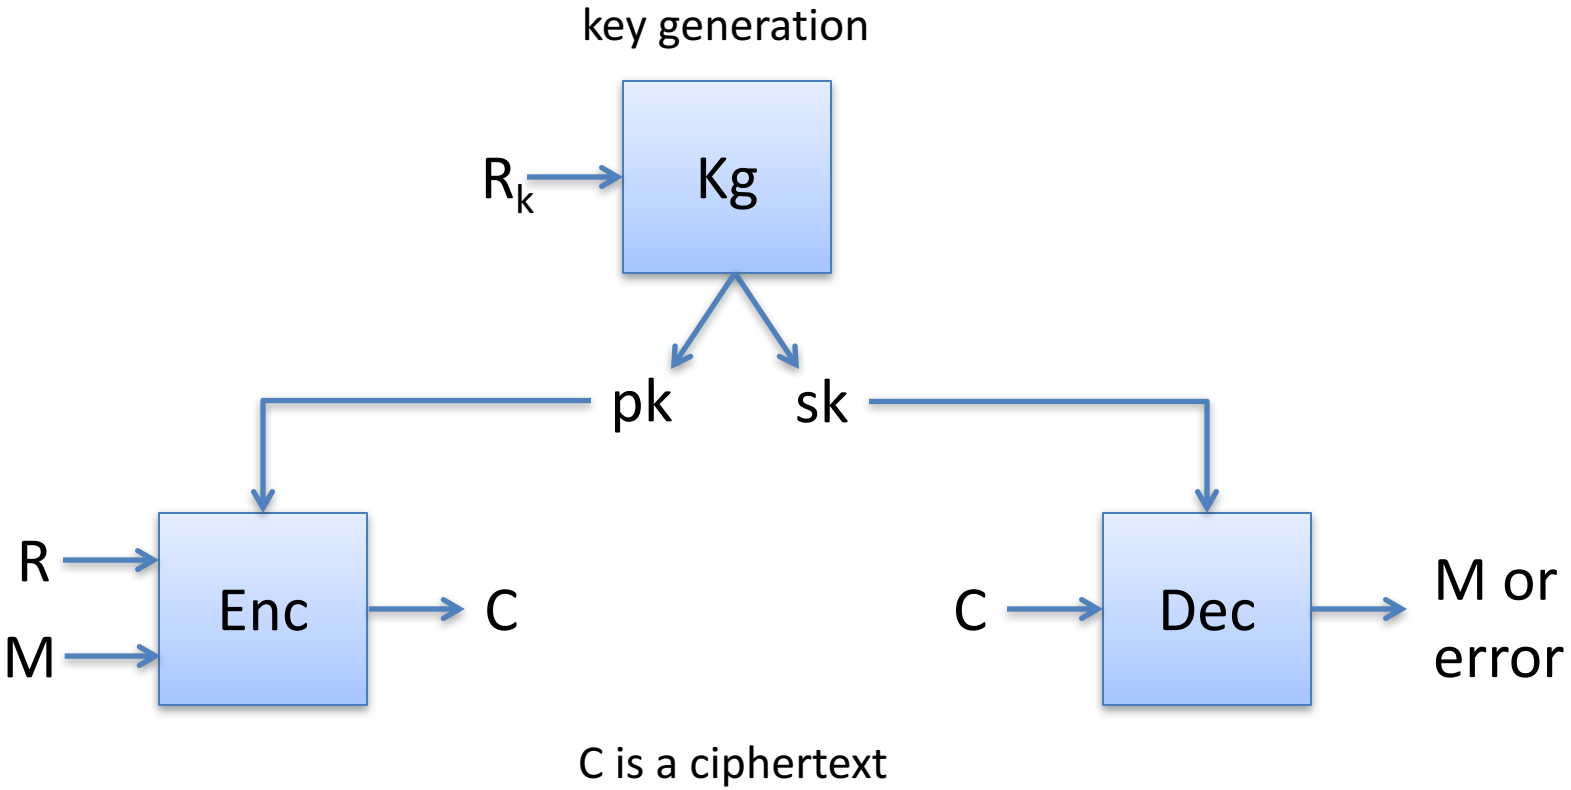
How to find suitable p,q prime?

Choose random numbers and test primality

Summary

- Find 2 large primes p, q . Let N = pq
  - random integers + primality testing
- Choose e (usually 65,537)
  - Compute d using $\phi(N) = (p-1)(q-1)$
- pk = (N,e) and sk = (N,d)
  - Often store p,q with sk to use Chinese Remainder Theorem

Public-key encryption



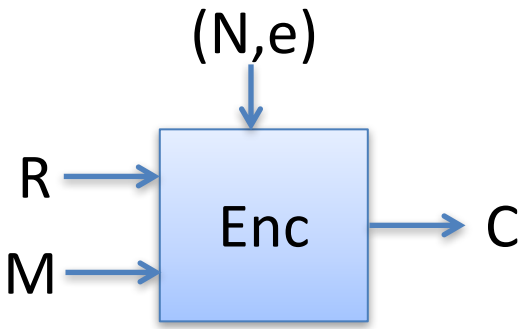
Correctness: D(sk , E(pk,M,R)) = M with probability 1 over randomness used

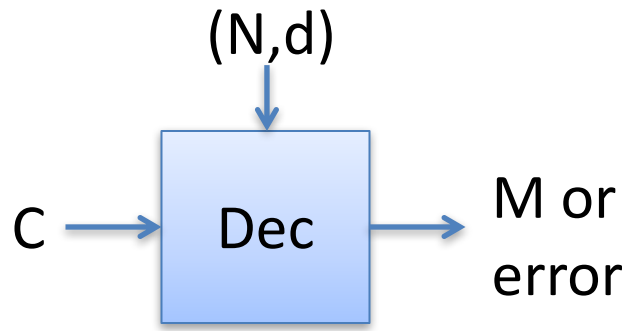
PKCS #1 RSA encryption

Kg outputs (N,e),(N,d) where $|N|_8 = n$

Let $B = \{0,1\}^8 / \{00\}$ be set of all bytes except 00

Want to encrypt messages of length $|M|_8 = m$





Enc((N,e), M, R)

pad = first n - m - 3 bytes from R that are in B

X = 00 || 02 || pad || 00 || M

Return X^e mod N

Dec((N,d), C)

X = C^d mod N ; aa||bb||w = X

If (aa ≠ 00) or (bb ≠ 02) or (00 ∉ w)

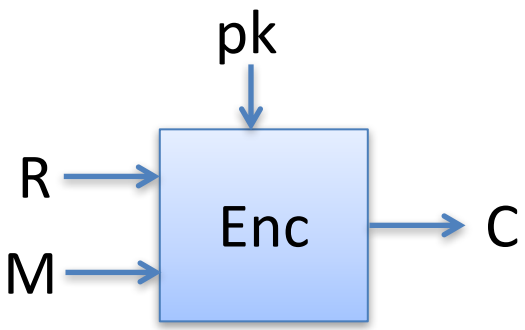
  Return error

pad || 00 || M = w

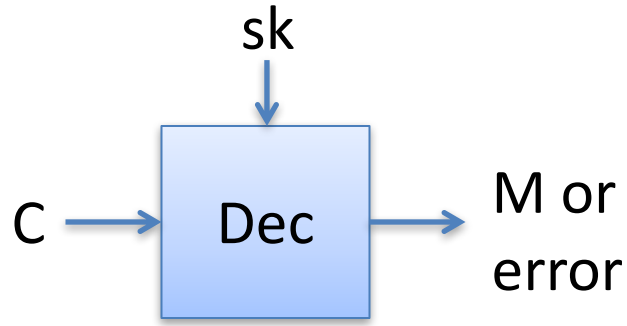
Return M

Hybrid encryption

Kg outputs (pk,sk)



Enc(pk, M, R)
K||R1||R2 = R
C1 = Enc(pk,K,R1)
C2 = Enc(K,M,R2)
Return (C1,C2)



Dec(sk, (C1,C2))
K = Dec(sk,C1)
M = Dec(K,C2)
Return M

TLS handshake for RSA transport

Bank customer

Bank

Pick random Nc

ClientHello, MaxVer, Nc, Ciphers/CompMethods →

Pick random Ns

← ServerHello, Ver, Ns, SessionID, Cipher/CompMethod

Check CERT using CA public verification key

← CERT = (pk of bank, signature over it)

Pick random PMS
C <- E(pk,PMS)

C →

PMS <- D(sk,C)

ChangeCipherSpec,
{ Finished, PRF(MS, “Client finished” || H(transcript)) } →

ChangeCipherSpec,
{ Finished, PRF(MS, “Server finished” || H(transcript’)) } ←

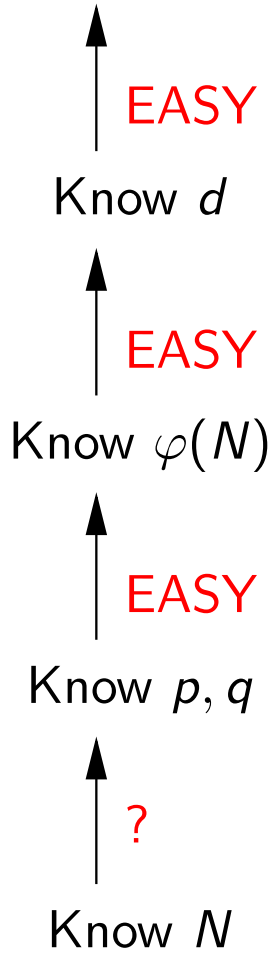
Bracket notation means contents encrypted

MS <- PRF(PS, “master secret” || Nc || Ns)

Security of RSA PKCS#1

- Passive adversary sees (N,e),C
- Attacker would like to invert C
- Possible attacks?

Inverting RSA : given N, e, y find x such that $x^e \equiv y \pmod{N}$



because $f^{-1}(y) = y^d \bmod N$

because $d = e^{-1} \bmod \varphi(N)$

because $\varphi(N) = (p-1)(q-1)$

Learning p,q from N is the factoring problem

We don't know if inverse is true, whether inverting RSA implies ability to factor

Factoring composites

- What is p,q for N = 901?

```
Factor(N):
for i = 2 , … ,  sqrt(N) do
      if N mod i = 0 then
            p = i
            q = N / p
            Return (p,q)
```

Woops… we can always factor

But not always efficiently:
Run time is sqrt(N)

$O(\text{sqrt}(N)) = O(e^{0.5 \ln(N)})$

Factoring composites

Algorithm	**Time to factor N**
Naïve	$O(e^{0.5 \ln(N)})$
Quadratic sieve (QS)	$O(e^{c})$ $c = d (\ln N)^{1/2} (\ln \ln N)^{1/2}$
Number Field Sieve (NFS)	$O(e^{c})$ $c = 1.92 (\ln N)^{1/3} (\ln \ln N)^{2/3}$

Factoring records

Challenge	Year	Algorithm	Time
RSA-400	1993	QS	830 MIPS years
RSA-478	1994	QS	5000 MIPS years
RSA-515	1999	NFS	8000 MIPS years
RSA-768	2009	NFS	~2.5 years
RSA-512	2015	NFS	$75 on EC2 / 4 hours

RSA-x is an RSA challenge modulus of size x bits

Security of RSA PKCS#1

- Passive adversary sees (N,e),C
- Attacker would like to invert C
- Possible attacks?
  - Pick |N| > 1024 and factoring will fail
  - Active attacks?

Bleichanbacher attack

I've just learned some information about $C_1^d \bmod N$

C_1 →

← padding error?

C_2 →

← padding error?

…

Dec((N,d), C)
X = $C^d \bmod N$; aa||bb||w = X
If (aa ≠ 00) or (bb ≠ 02) or (00 ∉ w)
Return error
pad || 00 || M = w
Return M

We can take a target C and decrypt it using a sequence of chosen ciphertexts $C_1, \ldots, C_q$ where q ≈ 1 million

[Bardou et al. 2012] q = 9400 ciphertexts on average

Response to this attack

- Ad-hoc fix: Don’t leak whether padding was wrong or not
  - This is harder than it looks (timing attacks, control-flow side channel attacks, etc.)
- Better:
  - use chosen-ciphertext secure encryption
  - OAEP is common choice

Summary

- RSA is example of trapdoor one-way function
  - Security conjectured. Relies on factoring being hard
- RSA security scales somewhat poorly with size of primes
- RSA PKCS#1 v1.5 is insecure due to padding oracle attacks. Don’t use it in new systems.
  - Use OAEP instead
